## WAN VPN Solutions

Companies are continually challenged in keeping up with evolving technologies and tools needed to match the increasing pace of business. These tools foster productivity in the office, but also need to be available to those workers on the go. With mobility comes the challenge of keeping everyone connected regardless of the device they use, their access method, the task they need to perform or where they are doing it from. Today's workers need immediate access to the full suite of those business tools. Virtual Private Networks (VPN) are a key enabler to have applications integrated into the network. TVL has evolved its core communications capabilities into end-to-end solutions that can maximize the way you communicate and collaborate, to change the way you do business.

TVL's WAN VPN Solutions are transported over an all fiber backbone network. The access technologies can be fiber, copper or P2P Microwave. We provide expert advice through our Presales team on the best solution for your business and a pool of experienced field Technicians for Service Assurance.

Our WAN VPN Solutions portfolio comprises of:

### Urban WAN VPN

Customers having to connect their Main Office in Port Vila to their different remote sites located within Efate.

### National WAN VPN

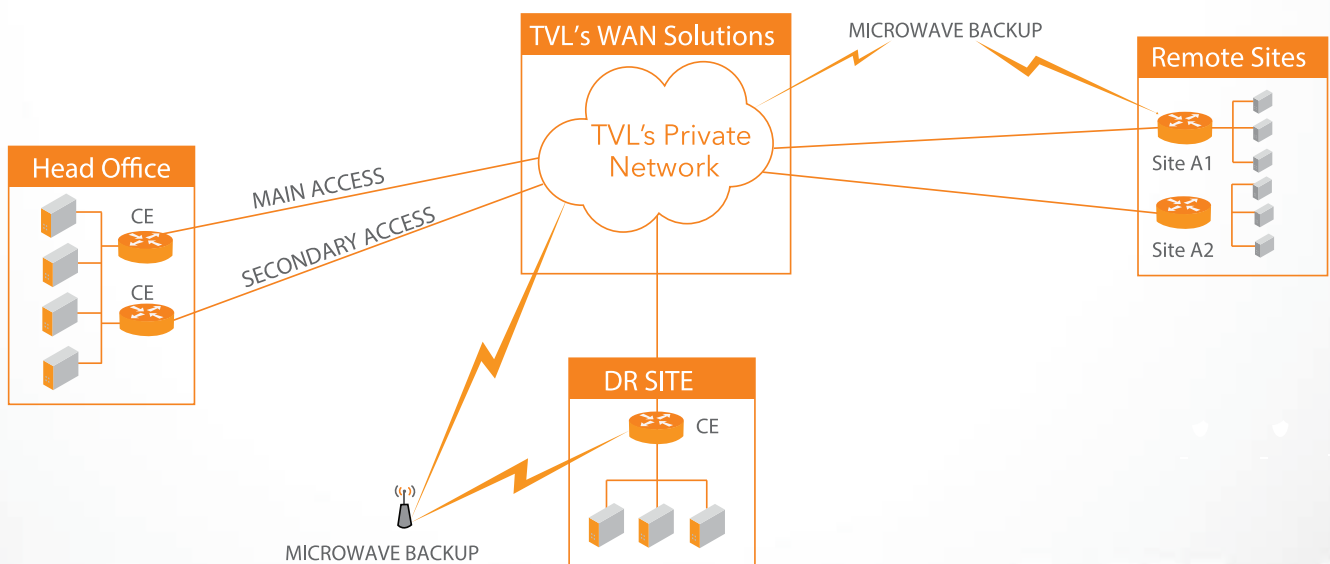

Customers having to connect their Main Office in Port Vila to their different sites located outside Efate.

The remote sites will be connected via our Inter-Island Microwave Packet Radio (MPR) links which is fully redundant

### Features of our WAN VPN solutions:

- Economies from providing voice and data on the same access line allow you to reduce access costs
- High-capacity and resilient optical fiber backbone network
- Dedicated access circuit which can be fiber, copper or P2P Microwave
- High network availability
- Flexibility to add new locations, applications and features to the network without rebuilding your network
- Service Level Agreements provide you assurances the network will operate with optimum uptime
